

BRMA® for companies of all sizes

S, M, L, XL, XXL...

How does it works?

Imagine a really well structured and built highway (BRMA® Mail Server and/or smartWEB®) really well structured and built with the best resources to support (process) the traffic of many cars (data).

Everything is in perfect harmony, but as time passes, the city (computing environment) grows and the flow of cars (data) transit by this road (BRMA® mail server and/or smartWEB®) increases each day. The consequence can be quickly perceived by drivers (users) of the road (BRMA® mail server and/or smartWEB®): the cars (data) are beginning to face greater competition and traffic starts to get complicated. This complication grows until it reaches a certain point when the maximum capacity of support (process) so many cars (data) is reached.

Restoring the flow (traffic capacity) is mandatory, and for such, the mayor (System manager), realizes that is necessary to duplicate (BRMA® Balance) the highway's traffic capacity (BRMA® Mail Server and/or smartWEB®).

Now, there are 2 (two) highways (BRMA® Mail Server and/or smartWEB®) to support the volume of cars (data).

CHALLENGE

Ensure a high availability of Internet access in corporative environments, where companies are even more in need for band and dependent of processes that cannot stop, requests a solution that supports contingency and scalability to follow the enlargement of its operation.

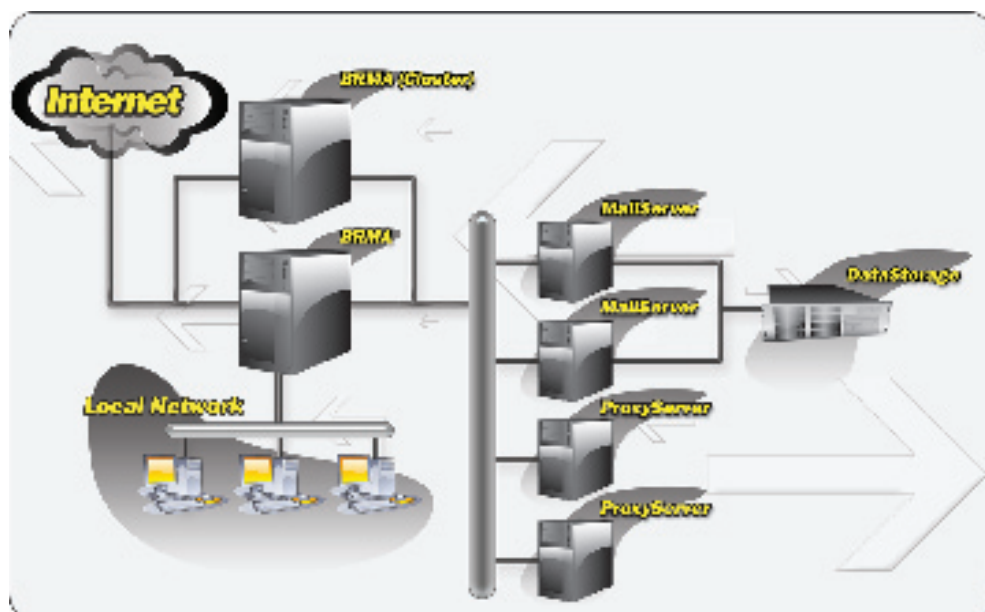

SOLUTION

The BRMA® Balance is the newest technology developed by BRconnection® and allows splitting and/or balancing emails processing tasks and analyze the Web Site's content (smartWEB®) in a way 100% transparent to the user.

That technology, associated with the redundancy cluster for the gateway, enables the use of BRMA® with any real company, regardless of size, segment, or criticality.

The idea is to scale the volume and traffic, and enable as many machines are required (except for the gateway) to work simultaneously and processing adequately, all user requests that are forwarded to the available server.

The BRMA® with BRMA® Balance technology meets any demand, in a scalable way, if your volume increase, you should just deploy new servers to expand processing capacity.
